E70f Service Manual

1. PRECAUTION AND NOTICES

1.1. SAFETY PRECAUTIONS

1. Observe all caution and safety related notes located inside the display cabinet.
2. Operation of the display with the cover removed, may cause a serious, shock hazard from the display power supply. Work on the display should not be attempted by anyone who is not thoroughly familiar with the necessary precautions when working on high voltage equipment.
3. Do not install, remove or handle the picture tube in any manner unless shatter-proof goggles are worn. people who are not so equipped should be kept away while handling picture tube. Keep picture tube away from the body while handling.
4. The picture tube is constructed to limit X-RAY radiation to 0.5 mR/HR. For continued protection, use the designated replacement tube only, and adjust the voltages so that the designated maximum rating at the anode will not be exceeded.
5. Before returning a serviced display to the customer, a thorough safety test must be performed to verify that the display is safe to operate without danger or shock. Always perform an AC leakage current check on the exposed metallic parts of the cabinet, such as screw heads. Test method for current leakage is described as follow.
 - (a) Plug the AC line cord directly into rated AC outlet (do not use a line isolation transformer during this check).
 - (b) Use an AC voltmeter having 5000 ohms per volt or with more sensitivity in the following manner: Connect a 1500 ohms 10 Watt resistor, paralleled by a 0.15mfd, AC type capacitor between a known good earth ground (water pipe, conduit, etc.) and the exposed metallic parts simultaneously. Measure the AC voltage across the combination of 1500 ohms resistor and 0.15mfd capacitor.
 - (c) Reverse the AC plug at the AC outlet and repeat AC voltage measurements for each exposed metallic part.
 - (d) Voltage measured must not exceed 2.8 volts RMS. This corresponds to 2 milliamp AC. Any value exceeding this limit constitutes a potential shock hazard and must be corrected immediately.

1.2. PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in this chassis have special safety visual inspections and the protection afforded by them cannot necessarily be obtained by using replacement components rated for higher voltages, wattage, etc. Before replacing any of these components read the parts list in this manual carefully. The use of substitute replacement parts which do not have the same safety characteristics as specified in the parts list may create shock, fire, X-RAY radiation or other hazards.

E70f Service Manual

1.3. SERVICE NOTES

1. When replacing parts or circuit boards, clamp the lead wires around terminals before soldering.
2. When replacing a high wattage resistor (more than 1W of metal oxide film resistor) in circuit board, keep the resistor about 5mm away from circuit board.
3. Keep wires away from high voltage, high temperature components and sharp edges.
4. Keep wires in their original position so as to reduce interference.
5. Usage of this product please refer to also user's manual.

1.4. HIGH VOLTAGE WARNING

Operation of monitor outside of cabinet or with back removed may cause a serious shock hazard. Work on these models should only be performed by those who are thoroughly familiar with precautions necessary when working on high voltage equipment.

Exercise care when servicing this chassis with power applied. Many B plus and high voltage terminals are exposed which, if carelessly contacted, can cause serious shock or result in damage to the chassis. Maintain interconnection ground lead connections between chassis and picture tube dag when operating chassis.

Certain HV failures can increase X-ray radiation. Monitor should not be operated with HV levels exceeding the specified rating for the chassis type.

The maximum operating HV specified for the chassis used in this monitor is

25.5KV \pm 1KV

with a line voltage of 120/240V AC. Higher voltage may also increase possibility of failure in HV Supply.

It is important to maintain specified values of all components in the horizontal and high voltage circuits and anywhere else in the monitor that could cause a rise in high voltage or operating supply voltages. No changes should be made to the original design of the monitor. Components shown in the shaded areas on the schematic should be replaced with exact factory replacement parts. The use of unauthorized substitute parts may create a shock, fire or other hazard.

To determine the presence of high voltage, use an accurate, high impedance, HV meter connected between second anode lead and CRT dag grounding device.

When servicing the High Voltage System, remove static charge from it by connecting a 10K ohm resistor in series with an insulated wire (such as a test probe) between picture tube dag and 2nd anode lead. (AC line cord disconnected from AC power outlet).

The picture tube used in this monitor employs integral implosion protection. Replace with tube of the same type number for continued safety. Do not lift picture tube by the neck. Handle the picture tube only after discharging the high voltage completely.

2. SERVICE TOOL & EQUIPMENT REQUIRED

1. MULTIMETER
2. OSCILLOSCOPE
3. SCREW DRIVER
4. IRON
5. ABSORBER
6. SOLDER

3. SPECIFICATIONS

3.1. PRODUCT SPECIFICATIONS

CRT:	Size:	17 inch Real Flat Type
	Viewable Size:	16 inch (Diagonal)
	Dot Pitch:	0.25mm
	Deflection:	90° Degree
DISPLAY:	Size:	310mm x 230mm
	Diagonal Size:	406.5mm
	Color:	Unlimited Colors
	Resolution:	Up to 1280 x 1024
	Pixel Rate:	110MHz
INPUT SIGNAL:	Video Signal:	RGB Analogue 0.7Vpp 75 Ohms
	Sync. Signal:	H/V. Separated, TTL. Level Positive or Negative.
	Scanning Freq.:	30 KHz to 70 KHz for Horizontal 50 Hz to 120 Hz for Vertical
POWER SOURCE:	Power Supply:	90 to 264 VAC, 48 to 62 Hertz.
	Power Consumption:	130W Max.

POWER MANAGEMENT

The Power Management states are controlled by the presence and/or absence of horizontal and vertical sync signals according to the following:

STATE	H. Sync	V. Sync	Power (normal)	LED
ON	ON	ON	130WATTS	GREEN
STANDBY	OFF	ON	15WATTS	ORANGE
SUSPEND	ON	OFF	15WATTS	ORANGE
OFF	OFF	OFF	3WATTS	ORANGE

8. GENERAL DESCRIPTION (17")

8.1. Video pre-amplifier:

The TDA4886 (IC901) is a monolithic integrated RGB pre-amplifier for colour monitor system with I2C bus control and OSD mixer. In addition to bus control beam current limiting. The signal are amplified in order to drive output driver LM2437T (IC904). Individual 3 DAC outputs (pin 23/20/17) for external cut-off control.

The RGB input signals with nominal signal amplitude of 0.7 Vb-w are capacitively coupled into TDA4886 from a 75 source and actively clamped to an internal DC voltage during signal black level by CLBL (pin 5) signal from deflection controller. A fast signal blanking is driven by CLBL signal and control bit DISV=1.

The input signal related to the internal reference black level can be simultaneous adjusted by contrast control via I2C bus with 6 bits DAC. For white point adjustment the individual for three channels gain control are driven by I2C bus with 6bit DAC too.

In the output stage the nominal input signal will be amplified to 2.8Vb-w output color signal at nominal contrast and maximum gain. Individual output clamping is to set the reference black level of the signal output to a value which corresponds to the extend cut-off voltage of the CRT cathodes, all feedback reference are driven by I2C bus.

The output signal from pre-amplifier R(pin19), G(pin22) and B(pin16) are sent to LM2437T to have around 40Vp-p amplitude, which are AC coupled to the CRT and need to be clamped to cut-off level. These are achieved by the black level clamp circuits C929, D911, R956, C928, Q907 Red channel, the rest channel are identical to it and all of three channels are control by TDA4886(R: pin 20, G: pin23, B: pin17).

The OSD signal are inserted during fast blanking active period, the OSD and fast blanking signal are generated by OSD IC MTV021N.

8.2. Micro controller:

The micro controller WT6016 is monitor micro controller with DDC (DDC1, DDC2B, DDC2B+ and DDC2AB) interface to the PC host. The internal built in hardware can detect sync. Presence for the VESA DPMS standard of various display mode with separated (pin 39:H 40:V) . The digital/analog voltage output can be used to control the video and deflection function of the monitor.

Besides to control two bus driven IC TDA4853 and TDA4886 via I2C bus, micro controller output still handle the rest function as V-DC shift, rotation, brightness, volume, stand-by , off mode, degaussing, LED color, H-unlock detector, ABL, s-cap switch, H-DC shift, and H-linearity. After alignment the data are stored at EEPROM 24C08.

8.3. Deflection controller:

The TDA4853 is a high performance and efficient solution for autosync monitors. All functions are controllable by I2C bus. TDA4853 provides synchronization processing, horizontal and vertical with full autosync capability, it provides extended function e.g. as a flexible B+ control., and extensive set of geometry control facilities.

The HSYNC (pin 15) is the input for horizontal synchronization signal which can be TTL

E70f Service Manual

separate or composite sync with positive or negative polarity. The horizontal oscillator capacitor at HCAP (pin 29) for optimum jitter performance the value of 10nF must not be changed. The given value is widely synchronised from 30KHz to 72KHz.

PLL1 phase detector compares the middle of horizontal sync with a fixed point on the oscillator sawtooth voltage. The PLL1 loop filter is connected to HPLL1(pin 26). Via register HPOS the I2C bus allows a linear adjustment of the relative phase between horizontal sync and oscillator sawtooth (in PLL1 loop). Via registers HPRAL and HPINBAL correction of pin unbalance and parallelogram is done by modulating the phase between oscillator sawtooth and horizontal flyback(in loop PLL2).

The PLL2 phase detector is similar to PLL1 detector and compares the line flyback pulse at HFLB(pin 1) with the oscillator sawtooth voltage. The control currents are independent of horizontal frequency. The PLL2 detector thus compensates for the delay in the external horizontal deflection circuit by adjusting the phase of HDRV (pin 8) output pulse.

EWDRV (pin 11) provides a complete EW drive waveform. The components horizontal pincushion, size, corner correction, and trapezium correction are controlled by the registers HPIN, HSIZE, HCOR and HTRAP.

The VSYNC (pin 14) is the input for vertical synchronization signal it can be TLL separate or extract from composite sync. With positive or negative polarity. The widely synchronization range from 50 to 120Hz.

The amplitude of the differential output currents at VOUT1 and VOUT2 can be adjusted via register VSIZE. Register VPOS provides a DC shift at the sawtooth output VOUT1 and VOUT2 (pin 13 and pin 12) and the EW drive output EWDRV (pin 11) in such a way, that the whole picture moves vertically while maintaining the correct geometry.

The horizontal moiré (also known as video moiré) can be cancelled by controlling register HMOIRE and cancelled vertical moiré (scan moiré) by controlling register VMOIRE.

The B+ function block can be used for buck converter in feed forward mode. It provides a frequency independent pulse width to control the deflection circuit.

8.4. Horizontal deflection:

The horizontal output signal IC401 pin 8 (limited at very low amplitude around 1.4Vp-p) directly fed to driver stage Q406, after boost to about 15Vp-p and amplifies current drive capability it drives output transistor Q407 to reach expected deflection current. The horizontal linearity correction circuits is composed by 3 segment S-cap. Switch (C423, C424, C425) and one controllable linearity coil L405 to get optimised linearity.

The B+ control output signal is modulated with geometry control and size control signal together, it directly fed to buck converter T404 via buffer stage Q404, Q405 to supply an adequate deflection voltage to output stage. The horizontal raster position control circuits is composed by D411, D412, L406, C481, R473 and L412 to reach right center position. To correct the tilt symptom while monitor facing the different direction or operating at various place, the rotation coil (plus control ckt. Q501, Q502, Q503, Q504...) is need to against the magnetic field changing.

8.5. EHT generator and Vertical output stage:

The EHT generator supplies 25.5KV anode voltage to picture tube. The generator is fully composed of the horizontal deflection but it is synchronized with the input horizontal sync.

E70f Service Manual

signal, this will prevent interference in the picture.

The output voltage is stabilised at 25.5KV. Feed back is taken from the anode via focus pack and C465, R435, C435, C475, R471 fed to IC402 TL431 to get very stable EHT so there is no need to compensate the deflection for EHT variation. The out voltage is kept constant by regulating the supply voltage of the EHT output stage. This regulation is done by means of a duty cycle controlled series regulator.

The generator is protected against over voltage (x-ray). It is activated if EHT exceed 27.5-29.5KV, the generator, will be switched off immediately by IC401

EHT generator also supply tertiary voltage for concern circuits like:

+50Vdc	: for vertical output stage
-190Vdc	: for spot killer
300Vdc	: for vertical dynamic focus

Under this configuration, stand-by mode just switching off IC801 output (pull pin 6 to ground) to achieve less than 15 Watt consumption .

TDA 4853 vertical differential output pin 12/13 fed to IC301 TDA4866 input pin 2/3 and boost to expected deflection current around 1.5Ap-p.

8.6. Power supply:

The power supply works. At a synchronized frequency about 30~72KHz in flyback mode and suitable for universal line input 90-264Vac. The proper PTC for the degaussing part, it working automatically at switch on for about 6 seconds or pushing an external button via OSD under PTC cold condition.

The mains voltage rectified D801~D804 (1N5406) and filtered C810 (220uF / 400V), is applied to the power transformer T803 while switching the power transistor Q805, transfer the energy to secondary side. Besides, an auxiliary voltage is obtained from primary side to supply the power controller KA3842B.

The power transformer secondary side rectified and filtered out defined voltage : +200V, +75V, -6.3V, +15V, +24V (+8V, +5V are drop out from +15V). +24V is sensed and subtracted to a stabilized reference voltage; the error signal is amplified and send to PWM circuits IC801, where it is compare with ramp waveform to keep constant voltage output by modulating duty cycle.

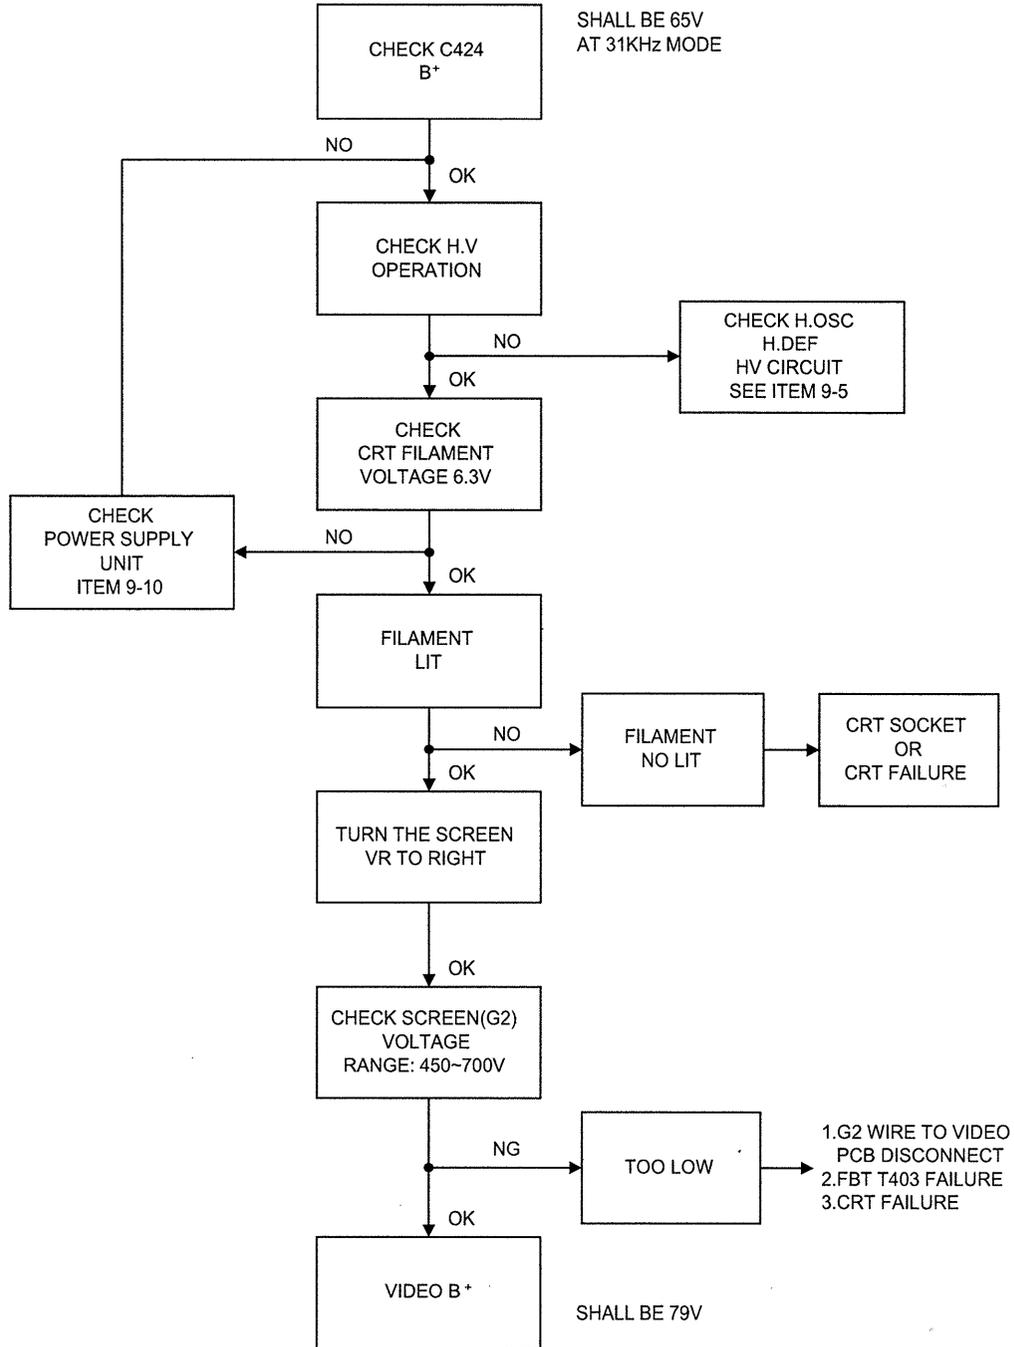

The primary current is sensed by the resistor R829, R817, when current increase to over current threshold point then power shut down immediately. When a short circuits occurs on the outputs at high voltage (+200V, +78V), the primary current increase in such a way that the power supply turns off. As regards to low voltage (+12V, -6.3V, +8V, +5V) output short circuits because of low power consumption increase and primary current does not reach the turn off threshold.

Power management off mode is directly switched off 6.3V and 15V and let power supply enter burst mode, it delivery out very low power (less than 5 watt).

 (B) FIXED OUTPUT : 8V,15V,79V,200V

E70f Service Manual

11. ADJUSTMENT

11.1. ADJUSTMENT CONDITIONS AND PRECAUTIONS

1. Approximately 30 minutes should be allowed for warm up before proceeding.
2. Adjustments should be undertaken only on those necessary elements since most of them have been carefully preset at the factory.

11.2. MAIN ADJUSTMENTS

NO.	FUNCTION	DESIGNATION
1.	B+ 79V ADJ.	VR801
2.	Raster Centering ADJ.(56K)	S401
3.	Focus ADJ.	FOCUS VR. (On flyback transformer)
4.	Raster Light Output	SCREEN VR. (On flyback transformer)
5.	HV ADJ.	VR404

11.3. ALIGNMENT PROCEDURES

Adjustment Conditions and Precautions:

- (1) Power supply voltage: AC 100~240V; 50/60 Hz.
- (2) Warm up time:
The display must be power ON for at least 20 minutes before starting alignments. This is especially critical in color temperature and white balance adjustments.
- (3) Signals: reference the front detail specifications and timing table.
Video : reference the front detail specifications.

1. Switching Regulator Unit:

- Conditions: (a) Set timing 60KHZ 1024x768
(b) USE cross-hatch pattern, BRI./CONT. be set to max.
adjust VR801 to get $79 \pm 0.5V$ voltage at the cathode of D814.

2. Anode Voltage Unit:

- Conditions: the same as ITEM 1.
adjust VR404 to get H.V $25.5 \pm 0.1KV$ for all tube.

3. RASTER CENTERING:

- Conditions: the same as ITEM 1.
Switch S401 till the raster in the spec.

4. Adjustment of White Balance

- Conditions: (a) Warm up time must be over 30 minute.
(b) Set 48KHZ 1024x768 2" square & raster pattern.
(c) Degaussing one time.
(d) Adjust H-SIZE $310 \pm 4mm$, V-SIZE $250 \pm 4mm$.

- (A) Enter color alignment system.

E70f Service Manual

- (B) 1. Set 9300 mode and then adjust SCREEN VR (G2) to 1.0FL.
2. Enter full white pattern and start alignment system to adjust dark balance to $X=283 \pm 5$
 $Y=298 \pm 5$.
3. disable R.G.B input and set BRI - DAC value equal to 50 and adjust SUB- BRI DAC value to get light output about $0.08 \pm 0.1FL$ (if impossible repeat ITEM B).
4. Enter 2" square pattern and adjust SUB-CONT DAC value equal to $50 \pm 2.0FL$.
5. Enter full white pattern and adjust ABL DAC value equal to $32 \pm 0.5FL$.
(C) Set 6300 mode and repeat ITEM B then get $X=313 \pm 5$, $Y=329 \pm 5$, $Y=50 \pm 2.0FL$.
(D) Set 5000 mode and repeat ITEM B then get $X=346 \pm 5$, $Y=359 \pm 5$, $Y=50 \pm 2.0FL$.

5. Focus Verification Condition:

- Conditions: (a) Set 60KHZ 1024x768 and EXT. BRIT. VR at detent , EXT. CONT. VR at max.
(b) Use text mode pattern especially "@" character.
(c) Let whole picture look clearly by adjusting static and dynamic focus VR.

6. Display performance and geometric adjustment:

Conditions:

- (1) equipment: a. 80486 PC. with printer port.
b. I²C cable.
(2) File : MAS.EXE (Main program).
product file
system file
(3) Main menu: Press F12 Adjust geometry

KEY			select item
			Increase, Decrease DAC value by one step
			Big step INC, DEC DAC value
			Abort
			OK

E70f Service Manual
