## DESCRIPTION

The TL431 is a three-terminal adjustable shunt regulator with specified thermal stability over applicable temperature  $V_{REF}$  (Approx. 2.5V) and 40V with two external resistors. This device has a typical dynamic output impedance of 0.2Ω. Active output circuitry provides a very sharp turn-on characteristic, making this device excellent replacement for zener diodes in many applications. The TL431 is characterized for operation from -40°C to +125°C.

The deviation parameters  $\Delta V_{REF}/\Delta T$  and  $\Delta I_{REF}/\Delta T$  are defined as the differences between the maximum and minimum values obtained over the recommended temperature range. The average full-range temperature coefficient of the reference voltage,  $\alpha V_{REF}$ , is defined as :

$$|\alpha V_{REF}|(\text{ppm}/^{\circ}\text{C}) = \frac{\left(\frac{V_{I(\text{dev})}}{V_{REF} \text{ at } 25^{\circ}\text{C}}\right) \times 10^6}{\Delta T_A}$$

Where :

$\Delta T_A$  is the recommended operating free-air temperature range of the device.

$\alpha V_{REF}$  can be positive or negative, depending on whether minimum  $V_{REF}$  or maximum  $V_{REF}$ , respectively, occurs at the lower temperature.

Example : Maximum  $V_{REF}=2496\text{mV}$  at  $30^{\circ}\text{C}$ , maximum  $V_{REF}=2492\text{mV}$  at  $0^{\circ}\text{C}$ ,  $V_{REF}=2495\text{mV}$  at  $25^{\circ}\text{C}$ ,  
 $\Delta T_A=70^{\circ}\text{C}$  for TL431C.

$$|\alpha V_{REF}| = \frac{\left(\frac{4\text{mV}}{2495\text{mV}}\right) \times 10^6}{70^{\circ}\text{C}} \approx 23\text{ppm}/^{\circ}\text{C}$$

Because minimum  $V_{REF}$  occurs at the lower temperature, the coefficient is positive.

## Calculating Dynamic Impedance

The dynamic impedance is defined as :  $|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_{KA}}$

When the device is operating with two external resistors, the total dynamic impedance of the circuit is given by:

$$|Z'| = \frac{\Delta V}{\Delta I} \approx |Z_{KA}| (1 + R1/R2)$$
